## The Client

One of the Pennsylvania Gaming Control Board's duties is to test and evaluate the accuracy of slot machines and other electronic games of chance.

This job requires the facility to store one of every game currently available, in a controlled environment, while being able to supply every game with power and keep power cords organized.

The control board was looking for a piece of furniture that would be sturdy enough to accommodate the 300+ pound machines and be adjustable to keep all the machines, despite their different heights, at a consistent height to evaluate.

## Storage Solution

The adjustable and durable workstations of the Technical Furniture Systems™ product line were an ideal fit.

The tables were modular, allowing them to be reconfigured as new machines were brought in for testing and old machines were returned to their casinos. The heights on each table top were also adjustable, to accommodate the taller machines. The table tops were exceptionally strong and resisted bowing, with a center support leg to help displace the weight of the machines.

Technical Furniture Systems™ come equipped with cable raceways, both horizontal and vertical, which allowed for the numerous cables of each machine to be organized, untangled, and off the floor.
