storage solutions

## The Client

Hard copy blueprints are a must at any construction site. That is why Re-Steel, makers of the steel bars used to reinforce concrete known as rebar, found it necessary to have a more space efficient and easier to use storage system for their archived rolled blueprints.

Since the prints are bulky and hard to manage, a system that kept them stacked neatly and easily categorized was ideal.

The previous system the used consisted of laminate cubby holes stacked on top of each other, which didn't hold nearly the capacity they needed.

## Storage Solution

Two MobileTrak5® systems equipped with heavy duty 4Post™ shelving were installed to solve their storage needs.

Each 4Post™ section was split into 8 equally sized cubes and enclosed on the rear with back panels to keep the stored prints from falling of the back of the shelves when accessed.

Each cube held a large number of rolled plans and were labeled by month and year to keep them organized.

The new system tripled their former capacity and allowed for a neater, more organized archiving system.
