storage solutions

The Client

The South Middleton Township municipal building was renovating their current building to convert a garage with sloping floors into a storage area.

Since their current form of bulk rack storage wasn't giving them the ideal storage arrangements or space conservation for their files and paperwork, they decided that some sort of high density shelving to accommodate their current needs and future growth was needed.

Storage Solution

A MobileTrak5® with 4Post™ shelving and rolled plan storage dividers was utilized to make the most out of their space.

Because of the drastically sloping floor used for drainage in the garage area, a special raised platform was created for a level surface and an ADA compliant ramp was added for a smooth transition into the new system. The ramp made the system easily accessible with rolling carts, ladders and wheelchairs.

The new system, standing over 10 feet tall, gave the municipal building room for their current files and plenty of space for future growth.

“The attention to detail during the design process resulted in a system that was exactly what we wanted. They took the necessary time to ask the right questions take all the necessary measurements, and provided insight into the details that other manufacturers had overlooked.”
